

Aquashine PTX actively stimulates cellular regeneration and renewal, improving and moisturizing the skin's texture and causing smoothing of wrinkles. The main advantage of the product is its multi-level action and control of all anabolic processes.

Composition

- Uncross-linked hyaluronic acid - 1.5% (15 mg/ml) - hyaluronic acid with a molecular weight of about 1000kDa to 3000kDa occurs in two multi-molecular forms: globular structure and reticular (reticular) structure. Low molecular weight hyaluronic acid with a reticular structure provides rapid hydration and penetration. The high molecular weight fraction is suspended in a reticular-globular structure, which promotes long-term deposition of peptides and their ability to penetrate
- Minerals to protect against negative environmental influences and give balance to the skin
- Coenzymes - reconstruction and regeneration of the body's enzymatic system
Amino acids for the process of protein synthesis
- A complex of 7 peptides that actively regenerate and fill the intercellular space, including:
 1. Decapeptide-29 and Oligopeptide-62 - muscle relaxation in the skin, "Botox-like" effect
 2. Acetyl Decapeptide-3 - collagen synthesis
 3. Oligopeptide-24, - Oligopeptide-72 - reconstruction and regeneration
 4. Oligopeptide-51, Oligopeptide-34 – glow and radiation

Techniques of application

- Linear retrograde - injection at a depth of 1.5-2 mm
- Injection - technique of a series of punctures to a depth of 1 mm
- Microinjection - micro lumps to a depth of 3-4 mm
- Cannula - subcutaneously along any direction.

Contraindications

- Pregnancy and lactation period
- Bacterial infections, local skin diseases and inflammation
- Uncompensated diabetes mellitus
- Neoplastic disease
- Allergies to the preparation used
- Taking blood-thinning drugs, such as aspirin
- Rheumatism
- A known allergy to hyaluronic acid
- Certain autoimmune diseases
- Tendencies to scar formation
- Infections within the treatment area
- Active herpes

The package does NOT contain needles.
