

## Effects

Treatment with HArmonyCa primarily causes an immediate increase in tissue volume, smoothing and tightening of the skin and flattening of wrinkles in the treatment area. However, the final effect of the therapy becomes visible only 3 to 4 months after the treatment. During this time, a stable collagen skeleton is formed.

Calcium hydroxyapatite has stimulating properties for up to 12 months after injection, and treatment effects are visible for up to 3 years.

An additional benefit is the recommended treatment series - a single treatment is sufficient to achieve long-lasting effects over many months. Calcium hydroxyapatite microspheres with a diameter of 25 to 45 micrometers (55.7%), cross-linked sodium hyaluronate gel (20 mg/ml), phosphate buffer. Lidocaine hydrochloride (3 mg/ml).
